Forests of The Anthropocene

In The Anthropocene, the trees in the forests will be cleaner,
shinier,
taller,
straighter,
and certainly more functional than those they replace,
with their branches that have the bad habit of falling
at the most inconvenient times;
showering splinters everywhere
and littering the ground with seeds that really need to be cleaned up by small animals,
which have the bad habit of caching them in the walls of our houses while spreading diseases
that we really can do without.

I'm sure glad we won't have to deal with any of that,
ever,
again,
in the forests of
The Anthropocene.
